

Leading Global Healthcare Firm Uses Secberus to Migrate, Manage and Scale Cloud Security With Confidence

Discover how Secberus is helping a leading healthcare company manage and scale cloud security.

The Requirements

This leading global healthcare company's mission is to improve the quality of human life through healthcare.

As a cloud-forward enterprise, the company understands the importance of partnering with innovative cloud services providers. So when the healthcare firm needed a dynamic security solution to help migrate 1,200 legacy applications to the cloud, Secberus's adaptable security platform came to mind.

The healthcare company needed a solution that would empower them to migrate the apps with minimal risk, as quickly as possible. It also wanted to create a best-in-breed security architecture that could act as a landing zone where relevant teams could fix defects, bugs and misconfigurations in real time.

Why They Chose Secberus

In order to meet the needs of their cloud-first environment, the healthcare firm needed to become more agile and flexible—two qualities most people do not associate with legacy systems. They quickly realized that Secberus's capabilities would enable their infrastructure owners and developers to understand and mitigate misconfigurations faster, which would get security "out of the way" of the business and put it to work for the business instead.

In other words, with Secberus at the center of the healthcare firm's cloud migration, security can actually hasten the ability of application owners and developers to understand what and where the real risks are. This insight empowers them to focus on building and fixing rather than guessing and plugging.

The VP of Security Architecture emphasized that the healthcare firm was looking for a business-focused security process that could work across all environments, leverage automation, and provide infrastructure owners with the visibility they need to take action the same day, if not the same minute. In other words, both insight and the power to act must be in the hands of the infrastructure owner—rather than making them wait to receive a list or a report.

Goals

As this relationship progresses, the healthcare firm will be able to quickly respond to key questions:

01. Is our environment secure?

02. Are we doing what's best for the business and right for security?

The Outcome: Confident Decisions in Real Time

Having the answers it needs to make confident decisions in real time will allow the company to tackle its most pressing issues rather than wasting resources chasing issues that do not have significant business impact.

So far, the VP of Security Architecture at this healthcare firm has been impressed with Secberus's ease of deployability. As he says, "If I'm only 50% licensed; I'm only 50% secure – or less." Having an easy, cloud-friendly pricing model as well as a "plays nice with others" integration philosophy makes implementing Secberus a smart and enjoyable experience.

Secberus has lifted a big weight off our shoulders in giving me and my security team the ability to know how to do what's best for the business and what's right by security--quickly and confidently."
